

How to Run the Scraper

- 1. Install Dependencies:** Make sure you have the required libraries installed:
`pip install requests beautifulsoup4 pandas`
- 2. Define URLs:** Prepare a list of URLs you want to scrape. For example:
`books_urls = ["http://books.toscrape.com/catalogue/page-1.html",
"http://books.toscrape.com/catalogue/page-2.html"]`
- 3. Initialize and Run the Scraper:** Create an instance of the WebScraper class and call the run method with the URLs and the platform type (e.g., "books").
`scraper = WebScraper()
scraper.run(books_urls, platform="books")`
- 4. Check Output:** The scraped data will be saved in a CSV file named `scraped_data.csv` in the current directory.

To run the code type `python app.py`
